Description

A code practice oscillator (CPO) produces a tone when the key lever is pressed.

A CPO is used to practice Morse code

A perfect kit for new builders, Scout or club groups and anyone interested in learning Morse code.

This is a basic and very easy to assemble kit.

Requires one hour or less to build.

Includes all electronic and mechanical components.

Features a professionally fabricated printed circuit board.

Includes a 2032 coil cell battery for operation.

The frequency of the tone generated may be varied to the user’s preference.

Note: Requires use of tools and soldering therefore, young builders should have adult supervision.
What is Needed to Assemble the Kit

A basic soldering iron
Solder
Small side cutters
Pliers
Small Phillips screwdriver.

Note: Soldering is required to assemble the kit, so if you have never soldered components before, first seek assistance or tutorials to learn basic soldering techniques.

Soldering Suggestions

☐ Use a soldering iron with a small tip.

☐ Conical or very small screw driver soldering tips are best.

☐ DO NOT use a large soldering iron or soldering gun.

☐ If you are a beginner, or someone new to soldering, there are a number of resources on the web to help you get on the right track soldering like a pro. Google “Soldering Techniques”.

Feed solder on opposite side from soldering iron so that the solder is melted into the joint.

Soldering iron positioned so that tip touches both the pad on the PC board and the component lead coming through the hole.
Parts Identification:

Note: Appearance of parts may vary slightly due to supplier changes.
Always verify the part label or if possible measure with a meter to be certain.

Parts List

Identifying the parts

Start by laying out and familiarizing yourself with the individual components, and matching them to the pictures below.

R2: 1K ohm resistor, (brown-black-red-gold)

R1: 50K ohm board mounted potentiometer

C1 and C2 capacitors are yellow in color and have the value code printed on them.

The mark of 103 is a 0.01uF capacitor

U1 – TLC555 8 pin Integrated circuit

SG1 – Piezoelectric transducer

Battery holder

SW1 – Power Switch

Socket Head Screw, 4-40 x 1/4” and Lockwasher
Pan head 4-40 x 5/16 Phillips head screws

4-40 nuts

#4 Nylon Spacers

Spring metal strip with yellow vinyl cap to form key lever

Rubber feet

2032 coin cell battery

Printed Circuit Board V2
Assembly
We will now install the components on the printed circuit board.

The location of each part is indicated on the circuit board as shown below:
Place each component into the area marked on the board one at a time and double check it is correctly installed.

Resistors and capacitors on this board do not matter which way they are installed.

Other components should be installed in the correct orientation. Some will only fit one way.

Once you are certain the part is correctly in the board, solder the component leads on the backside of the board.

Check that the part is seated to the board and if so, trim the component lead on the back side.

If not, reheat one lead at a time and press the part gently until it seats in the board.

**Installation of Parts**

Install the parts following the steps below:

- **R1** – 50K ohm potentiometer. Note that it only fits one way in the board.
- **R2** – 1K ohm resistor (brown-black-red-gold). Orientation does not matter
- **C1** - .01uF capacitor (labeled: 103) Orientation does not matter
- **C2** - .01uF capacitor (labeled: 103) Orientation does not matter

**U1** – TLC555 8 pin DIP, Integrated circuit.

- **Note:** that U1 will either have a notch on one end or a small dot on the top of one corner.

  This is used to indicate where its Pin 1 is located to correctly orient it in the board.

  Install U1 so that its pin #1 end is located on the same end as the notch in the outline on the printed circuit board as shown in this photo.

- **Note:** Before soldering, double check the U1 orientation, because this component is difficult to remove after soldering.

  Solder one pin of U1 and check that it is seated to the board. If not reheat the pin and seat the IC.

  Once it is seated, solder the remaining pins of U1 one at a time and trim on the back of the board.
Piezoelectric transducer SG1

Install the transducer, making sure it is oriented as shown in this photo with the label closest to the board edge.

Battery holder:

Place the battery holder on the board and solder the two pins making sure it is aligned to the board markings and seated on the board.

Switch SW1:

Install the on/off switch SW1 in the marked location on the board. Orientation does not matter.

Contact Screw:

Install the socket head screw into the single hole in the board placing the lockwasher under the screw head as shown.

Secure on the bottom of the board with one of the hex nuts and tighten.

This serves as the contact for the key lever.
Key lever:

Place the two 5/16” pan head screws through the holes in the metal lever and add two nylon spacers to each screw.

This will result in a stack of two washers under each screw of the key lever. This is to raise it a bit above the board to allow room to press the lever.

Put the screws through the pair of holes in the circuit board and secure on the bottom with the remaining two hex nuts.

Tighten the screws to secure the lever in place

Gently bend the lever upward slightly (if needed) so that it sits just slightly above the contact screw.

The keying lever should only make contact when it is pressed down.

The lever should look like this when completed

Lastly, apply the four rubber feet, on the bottom of the board at the corners.
Congratulations, this completes assembly of your Pacific Antenna Code Practice Oscillator Kit!

The finished board should now look like this:

![Board Image]

Install the battery and turn the switch to on (slide the white slider toward the closest edge of the board)

Press the key lever downward to contact the socket head screw and you should hear a tone.

The tone frequency can be adjusted by turning the potentiometer, R1.

You will note that the tone will be louder at some frequencies due to the frequency response of the piezoelectric transducer.

**Note:** When your CPO kit is not in use, you should switch off the switch located near the battery holder to prevent draining the battery.

**Troubleshooting:**
If nothing is heard, the most common fault is bad solder joints.

Inspect the board carefully with a magnifying glass, and correct any bad connections.

However, sometimes it is difficult to see your own mistakes, so have another person look at your work.
